

File Association

The first step consists of creating a *.smg file using the *Save As* option of the application's *File* menu. From this point, the steps are described below:

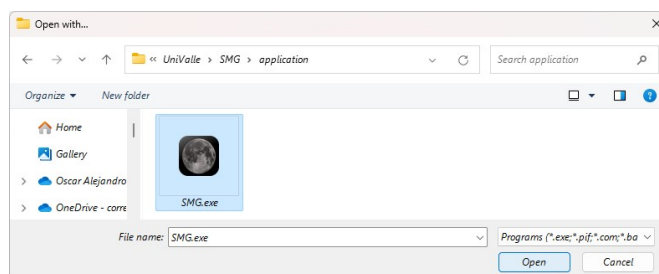

- Find the *.smg project, right-click on it, and select the *Open with* option of the deployed menu.

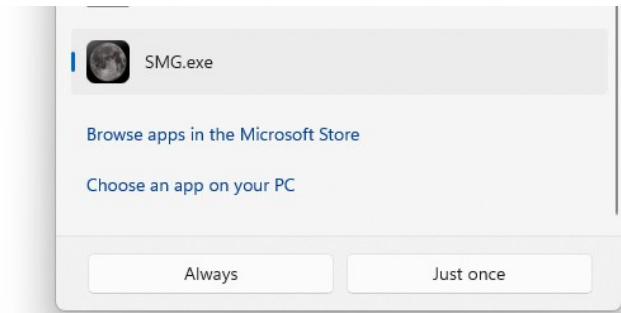

- Select the option *Choose an app on your PC*.

- Find the .exe of the SMG application (By default is in: *C:\Program Files\UniValle\SMG\application*), and select the *SMG.exe* file.

- Select the application icon on the list and press the *Always* button.

Once the association process is complete, you can double-click on a project file to open the *Synthetic Moonquake Generator* application and load the values associated with the project.
